## Sample Assignment 1

Okko Makkonen\* February 11, 2023

These are some fundamental and elementary theorems within the mathematics done in ancient Greece with proofs in modern language.

## Problem 1

Claim. The square root of 2 is irrational.

*Proof.* Assume that there exists  $a, b \in \mathbb{Z}$  with  $\gcd(a, b) = 1$  such that  $\frac{a^2}{b^2} = 2$ . Then  $a^2 = 2b^2$ , so a is even. Thus, a = 2c, and  $2c^2 = b^2$ , which means that b is even. This contradicts our assumption that  $\gcd(a, b) = 1$ , so  $\sqrt{2} \notin \mathbb{Q}$ .

## Problem 2

Claim. There are infinitely many primes.<sup>1</sup>

*Proof.* Assume that there are finitely many primes, say  $p_1, \ldots, p_N$ . Consider the number  $q = p_1 \cdots p_N + 1$ . It is clear that  $p_i \nmid q$ , so by the fundamental theorem of arithmetic there must be another prime factor of q that is not on the list  $p_1, \ldots, p_N$ . This contradictics our assumption of having a finite number of primes.
